

THRIVE Console

The backend where staff and faculty manage the THRIVE student hub — its content, records, and day-to-day operations.

Version 1 · 12 Sep 2026 · covers the admin-console build

1. What this is

The THRIVE Console is the control panel behind the student app. From one place you can edit what the assistant knows, review and correct its answers, manage courses, advisors, events and student records, and run maintenance jobs. It runs at the web address `/admin/` on the THRIVE server.

There are two kinds of user:

- **Admin** Full access — every record, plus Content management and Operations.
- **Faculty** Scoped access — read the curriculum and review/correct the bot's answers.

2. Getting in

1. Open the console at `https://rsm-vnijs.ucsd.edu/thrive/admin/` (or, when testing locally, `http://127.0.0.1:8000/admin/`).
2. Sign in with the username and password you were given.
3. You'll land on the console home, which lists the sections you're allowed to use.

If you see a login page again after signing in, your account isn't in a console group yet. Ask an administrator to add you to **THRIVE Admin** or **THRIVE Faculty**.

3. The home page

The home page groups everything by area. The main things you'll use:

SECTION	WHAT'S THERE	WHO
Content management	Edit the catalog; re-ingest the corpus the bots answer from.	Admin
Operations	Run maintenance jobs (rebuild catalog, refresh jobs, reports, evals).	Admin
Answer review	Read the bot's answers and record corrections.	Admin, Faculty
Courses / Syllabi	The curriculum. Faculty can read; admins edit.	Admin edit, Faculty read
Advisors, Appointments, Events	Scheduling records.	Admin
Jobs, Resume, Skills	Career records.	Admin
Students, Requests, Tasks	Student profiles and their activity.	Admin
Chat oversight	Full turn traces with the passages behind each answer.	Admin

4. Common tasks

Edit the catalog Admin

1. Open **Content management**.
2. Under Catalog, click the file to edit (`courses.json` , `careers.json` , or `bundles.json`).
3. Make your change in the editor. It must stay valid JSON.
4. Click **Validate & save**. The console checks the JSON, saves the file, and refreshes the bots' caches so the change is live.

For course facts that come from a syllabus, the durable path is to edit the syllabus and then run **Rebuild catalog** on the Operations page, rather than editing `courses.json` by hand.

Re-ingest the corpus Admin

1. Update the source markdown for the corpus on the server (under `data/corpus/`).
2. Open **Content management** → Corpus re-ingest.
3. Choose the directory that changed, then click **Re-ingest**.
4. Wait for the confirmation. Re-ingest re-reads, re-chunks, and re-embeds the documents.

Important: on the live server, re-ingest must run with the production model backend so the new text is embedded the same way as everything else. If in doubt, ask the maintainer before running it in production.

Review and correct a bot answer Faculty Admin

1. Open **Answer review**.
2. Filter or search to find the answer you want (by topic, route, or whether it was refused).
3. Open the turn to see the question and the bot's reply.
4. In the Corrections box, add a note describing what's wrong and what's correct, then Save. Your name and the date are recorded automatically.

Note: corrections are recorded for review today; feeding them back into the bot's answers is a planned next step.

Run a maintenance job Admin

1. Open **Operations**.
2. Find the job you want (rebuild catalog, refresh jobs, retry notifications, refusal report, export evals, run evals, seed demo).
3. Click **Run**. The job runs and its result is shown at the top of the page.

Manage a record (course, advisor, event, ...) Admin

1. Click the section on the home page (for example, Courses).
2. Use search and the filters on the right to find a row, or click **Add** to create one.
3. Edit the fields and Save. Related items (a course's meetings, an advisor's slots) are edited inline on the same page.

Give someone console access Admin

1. Open **Authentication → Users** and find the person (they must have signed in at least once, or be created here).
2. Set **Staff status** on, so they can reach the console.
3. Add them to the group **THRIVE Admin** or **THRIVE Faculty**, then Save.

5. Good habits & safety

- Catalog edits go live immediately — double-check JSON before saving.
- Corpus chunks are shown read-only on purpose; change corpus text by editing the source and re-ingesting, not by editing chunks.
- Run re-ingest and heavy Operations jobs at quiet times; they run while you wait.
- Student records contain personal information — only admins see them, and only for legitimate program work.

6. Troubleshooting

SYMPTOM	FIX
Sent back to login after signing in	Your account isn't in a console group. An admin adds you to THRIVE Admin or Faculty.
"Bad Request (400)"	You opened a web address the server doesn't recognize. Use the exact console URL.
A section is missing from your home page	Your role doesn't include it. Faculty see the curriculum and Answer review only.
"Not saved — invalid JSON"	The catalog edit has a JSON error; the message points to where. Fix it and save again.
An Operations job reports an error	The message shows why. Note it and send it to the maintainer.

7. For the maintainer

Setting the console up on a machine, from the `backend/` directory:

STEP	COMMAND
Install deps	<code>uv sync</code>
Apply migrations	<code>uv run python manage.py migrate</code>
Create an admin	<code>uv run python manage.py createsuperuser</code>
(Optional) demo data	<code>uv run python manage.py seed_demo</code>
Run it	<code>uv run python manage.py runserver</code> → open <code>/admin/</code>

The two groups (THRIVE Admin, THRIVE Faculty) are created automatically by the migrations. Assign users to them under Authentication → Users. The code lives in `backend/rsm_thrive/admin_modules/` ; the companion blueprint document has the full file map and diagrams.
